A Gentle Introduction to R

Jonathan Whiteley

2023-08-11

Prerequisites

- Access to a copy of the $\mathbf{R}$[1] software

  - i.e., a "binary executable"

  - Go to *www.r-project.org* to get a copy,
    or ask your system administrator.

- No previous experience with R or programming required.

---

[1] The R logo ($\mathbf{R}$) is © 2016 The R Foundation and used as-is under the terms of the **CC-BY-SA 4.0** license

Section 1

Welcome

Pop Quiz

We will review these *at the end*, so you can see how much you have learned.

- What does 'CRAN' stand for?
- Why is it named 'R'?
- How can you use R *interactively*?
- How do you find out what a function does & how to use it?
- How do you store values to re-use later?
- True or False: Warnings can be ignored, but an Error means I made a mistake.
- True or False: Error messages will tell me how to fix the problem.

Answer in the chat:

What emoji best describes your current mood or state of mind?

Introductions

- Name
- Pronouns
- Job title, role
- *optional*: a hobby or activity you enjoy?

- Have you used R before?
- Have you used a programming language before?

Icebreaker activity

What is this?

1–3 word description, for example:

- "This is grey"
- "This looks uncomfortable"

OR caption this image?

On your turn:

1. Previous person's name
2. Their answer to the question
3. Your name
4. Your answer
5. Name of the person to go next

Figure 1: Caption this image.

Learning Objectives

- Get familiar with the ®R *interface*
- Use technical *terms* for R concepts
- Enter *commands*
  - ▶ use R interactively: understand input & output
  - ▶ use some common *functions*
- Get familiar with 'R objects'
  - ▶ store & retrieve values
- Understand *Errors*, *Warnings*, and *Messages*
- How to get Help

Why is it named 'R'?

1. R started as an *open-source* implementation of the
   S statistical computing language (S-PLUS)[2]

   - S was created at Bell Laboratories in 1976[3]

   - R was based on the S syntax (mostly v3), but works very differently
     "under the hood".

2. R was created by **R**oss Ihaka and **R**obert Gentleman — aka "R & R"[4]
   — at the University of Aukland in the early 1990s.

Read more about the history of R on Wikipedia[5]

Section 2

Interacting with R (Interface)

The R Interface

- 'base R' has a slightly different interface for each **O**perating **S**ystem (OS)
  - GUI = **G**raphical **U**ser **I**nterface
- R can also run inside of a terminal (no GUI) or other software (different GUI).

Integrated **D**evelopment **E**nvironment (IDE)

- An IDE is like an extra interface layer on top of 'base R'
- IDEs often add convenient tools to make writing code easier (e.g., syntax highlighting), and for developing larger projects with multiple files.
- **RStudio** is one of the most popular cross-platform IDEs for R.
  - RStudio is available in open source (free/libre) and commercial[a] editions.

---

③ top:
**Environment,
History, . . .**

④ bottom:
**Files, Plots,
Help, . . .**

_____

[a] empty until you create or open a file

Interacting with R

- Regardless of the GUI, you interact with R primarily using a *command line*

  - aka a command line interface (cli)
  - the command line is usually in the *console*

- "Question-and-Answer Model"

  - You ask R to do something (a *command*),
    and R tells you the answer (*result*).

- Instructions are given to R using the *R language*.

The ℝ console

The *console* is a window or pane where you will find:

- The *command line*
  - where you will enter commands for R to run

- Results of commands and other output

- Messages, *Warnings*, and **Errors**

The R command-line

- The command *prompt* normally looks like this:

```
>
```

(the colour varies depending on the interface)

  - This is R's way of saying "I am ready to accept new commands".
  - Type a new command on the line after this prompt (i.e., *input*).

- **Press return/enter to *run* the current *command***

- If you can still edit the command next to the prompt, then it has not been submitted to R to execute (it is still waiting for input).

- If the last prompt is not empty (i.e., there is text beside it) *and* you cannot edit what is beside the prompt, it means R is still running the last command and is not ready to accept a new command yet.

  - Wait for a new empty prompt to appear before entering the next command.

The R command-line (continued)

- If the prompt looks like this:

  ```
  +
  ```

  it means the last command was *incomplete* and R is waiting for more input.
  R will not do anything until the command is completed or cancelled.

  ▸ This usually means you forgot a closing
  quote ", *parenthesis* (, *bracket* [, or *brace* {

- You can *cancel* the current command at any time by pressing escape (esc)

Section 3

Warming up: some early commands

Input & Output

In this presentation,

- *commands* that can be entered in the *command-line* look like this:

  ```
  Input (commands)
  ```

  - ▸ You can try these yourself!

- Expected output (results) look like this:
  ```
  Output (results)
  ```

R offers suggestions
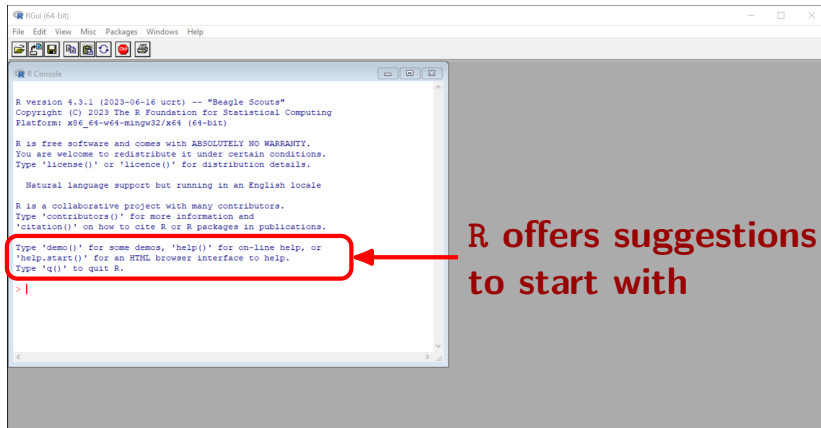

Read the opening message carefully.

Figure 4: R offers suggestions of commands to Type in the console when it starts.

R is a show-off

`demo(graphics)`	• some plots and graphs that can be made with R
`demo(image)`	• image-like graphics and maps that can be produced with R
`demo(lm.glm)`	• a demonstration of linear modelling & GLMs
`demo()`	• a list of available demos
`help.start()`	← A great place to start, especially if you are comfortable reading documentation for a programming language. More on this later.

Note

R will not only show the output, but also *the code used to produce it*.

R is a show-off (alt)

```
demo(graphics)
demo(image)
demo(lm.glm)
demo()

help.start()
```

- some plots and graphs that can be made with R
- image-like graphics and maps that can be made with R
- a demonstration of linear modelling & GLMs
- a list of available demos

A great place to start, especially if you are comfortable reading documentation for a programming language. More on this later.

Note

R will not only show the output, but also *the code used to produce it*.

R is a calculator

```
1 + 1
```
```
[1] 2
```

```
10 - 1
```
```
[1] 9
```

```
2 * 2
```
```
[1] 4
```

```
8 / 2
```
```
[1] 4
```

```
2 ^ 3
```
```
[1] 8
```

```
sqrt(9)
```
```
[1] 3
```

- These are *expressions*
- *Expressions* are *evaluated*, and the *value* (result) is *returned* (sometimes *invisibly*)

R command-line tips

- With the cursor next to the empty prompt (>),
  use the up & down arrow keys (↑↓) to re-produce previous commands.

- This lets you "scroll through your *command history*".

- Press up (↑) once, and you get the last command you entered
 without having to copy & paste.

Section 4

Simple R objects

Vectors

- The most basic kind of *object* in R is a *vector*

- Think of a vector as a list of related values (data),
  which are *all the same type*

- A single value is an "*atomic vector*" (a vector with a length of 1)

index: the item number → `[1]  2` ← *value*

`1:10`

```
[1]   1  2  3  4  5  6  7  8
[9]   9 10
```

Vectors

- Vectors can be used in calculations

- Operations are applied to each item (*element-wise*)

```
sum( c(1, 2, 3, 4, 5) )
1:10 + 2
1:5 * 5:1
```

- Vectors can be used to plot data in a graph

```
plot( rnorm(1000) )
hist( rnorm(1000) )
```

Some data *types* (of *atomic vectors*)

numeric
- Includes *integers*, *real* (decimal / *double*), and *complex* numbers.
- `1.23`

character (*string*)
- in single `'` or double `"` quotes.
- `'hello world'`
- `"1.23"`

logical
- `TRUE` or `FALSE`

```
class(1.23)
class('hello')
class("1.23")
class(FALSE)

typeof(1.23)
typeof(1:10)

as.character(c(1,2,NA,4))
```

`as.*()`: converting from one type to another = *coercion*

Section 5

Storing & retrieving values

Symbolic *variables*

- You can store values (*objects*) in symbolic variables (*names*) using an *assignment operator*:

`<-`	assign the *value* on the **right** to the *name* on the **left**

- Names can include:

letters	`a-z A-Z`
numbers	`0-9`
periods	`.`
underscores	`_`

  ```
  A <- 10
  B <- 10 * 10
  A_log <- log(A)
  B.seq <- 1:B

  assign('x', 3)
  ```

- Names *should begin with a* **letter**.

Retrieve values

When a variable *name* is evaluated, it returns the stored *value*.

```
A
[1] 10
```

```
B
[1] 100
```

```
A_log
[1] 2.303
```

```
x
[1] 3
```

```
B.seq
```

```
  [1]   1   2   3   4   5   6   7   8   9  10  11  12  13
 [14]  14  15  16  17  18  19  20  21  22  23  24  25  26
 [27]  27  28  29  30  31  32  33  34  35  36  37  38  39
 [40]  40  41  42  43  44  45  46  47  48  49  50  51  52
 [53]  53  54  55  56  57  58  59  60  61  62  63  64  65
 [66]  66  67  68  69  70  71  72  73  74  75  76  77  78
 [79]  79  80  81  82  83  84  85  86  87  88  89  90  91
 [92]  92  93  94  95  96  97  98  99 100
```

Built-in variables

Some words and letters already have values in R
and should **never be used as variable names**.

```
pi
```
```
[1] 3.142
```

```
version
```
```
... information about
this version of R ...
```

```
letters
```
```
 [1] "a" "b" "c" "d" "e" "f" "g" "h" "i" "j" "k" "l" "m" "n"
[15] "o" "p" "q" "r" "s" "t" "u" "v" "w" "x" "y" "z"
```

```
LETTERS
```
```
 [1] "A" "B" "C" "D" "E" "F" "G" "H" "I" "J" "K" "L" "M" "N"
[15] "O" "P" "Q" "R" "S" "T" "U" "V" "W" "X" "Y" "Z"
```

Reserved words

Some words and letters already have special meaning in the R language (*keywords*) and should **never be used as variable names**.

NA	"Not Available"	placeholder for unknown or missing values
NaN	"Not a Number"	placeholder for *undefined* numeric values
NULL	*a special object*	placeholder for missing *objects*
Inf	Infiniti	
TRUE	Logical value	
FALSE	Logical value	
T	short for TRUE	
F	short for FALSE	
c,q,t,C,D,I	R functions	
diff, df, pt	R functions
